

94-0189

Using: in veterinary, especially for sexual activity of animals uteruses, mainly of cows and pigs.

The summary of the invention consists in the fact that preparation is prepared from an umbilical cord, chorion and amnion. There eliminate the vascular vessels from umbilical cord but chorion is divided on the smooth and villous, then each part is put into the water that is systematically changed up to complete bloodlessness. After that all three ingredients are separately denatured: the umbilical cord and smooth chorion by 0,19-0,21% chlorine solution and villous chorion by 0,36-0,4% the same solution at ratio (raw material: volume of solution) 1:4 - 1:6 during 3-5 days.

Then the chlorine solutions are poured off and raw material is washed by distilled water up to increasing of pH solution up to 2,5-3. Water is removed, the umbilical cord and smooth chorion is roughly cut very small, after that all three ingredients are mixed, common mass is diluted by dispersed up to dimensions of particles no more than 0,4 mm.
