

94-0190

The invention relates to the veterinary medicine and can be used for the lactogenic preparation obtaining for prophylaxis and treatment of farm animals, preferably pigs. The purpose of the invention consists in increasing the curative-prophylactic effectiveness of the preparation. The chorion is divided on plain and villons and each part after chopping is matured into water till a complete hemolysis, then into the 0,2% chlor solution on the basis of natrium choride isotonic solution till a complete denaturation, then is immersed into the distilled water and the value pH is brought to 0,3. The mass is exposed to treatment with natrium chloride isotonic solution, is shopped and mixed. Utilization of the preparation for treatment of adult female pigs having postpartum complications accompanied by hypogallactia, ensures recovery of indult female pigs on the 5-7th days of treatment and allows to attain the 95% keeping of piglets.
