

95-0116

The invention relates to the fruit tree branches cuttage. The method is characterized by the fact that in the first year the cutting-back of the annual branches is carried out by leaving the last inner bud, then next year the well-grown branch from the upper bud growing inside the crown is removed from the base.

The proposed method allows to obtain a compact crown and increases the tree fruitage beginning and may be applied to cherries, apple-trees, apricots, plum-trees and other sorts of fruit-bearing trees.
