

96-0063

The invention relates to the agriculture, in particular, to the farm products storing devices.

The summary of the invention consists in the fact that the ice freezing installation comprises a capacity, into which there are placed two vertical electrodes connected to the control unit and a valve aqueduct also connected to the control unit, characterized by the fact that onto one of the electrodes, at a distance, there are applied horizontal strips of dielectric material.

The technical result consists in metering the water feed and in the layer freezing of ice.
