

The invention relates to containers for metered delivery of liquid, and can be used in particular by sportsmen for consumption of liquid, at certain intervals, during trainings or sports events.

The container for metered delivery of liquid consists of a body with a threaded cover and a removable bottom (4). In the lower part of the body is transversely fixed a partition with an opening and a conical bottom (7), which delimits in the body a metering chamber (13), communicating through the opening with a supply chamber (5), formed by the removable bottom (4). The container is provided with an air valve, connected via a tube to the supply chamber (5), a tube for air outlet from the supply chamber (5) into the metering chamber (13) and a liquid outlet tube.
