

The invention relates to agriculture, namely to frames for greenhouses, used in farms, as well as in individual farms. The frame for greenhouse comprises vertical posts (1), rigidly mounted on a base (5), a roof (2) and walls (4), connected to the ground and the roof (2). In the upper part of the posts (1) or at the ends thereof are rigidly fixed devices (3) for lifting and lowering the roof (2), made with screw pairs. At the lower ends of the devices (3) are horizontally fixed plates, on which is fixed the roof (2). The walls (4) are made with the possibility of their folding.
