

The invention relates to the drying equipment, namely to devices for uniform distribution of air in the tunnel dryer, and can be used in small agricultural farms for drying fruits, vegetables, etc.

The device for uniform distribution of air in the tunnel dryer consists of an air passage body (2) in the form of an inverted truncated regular quadrangular pyramid, wherein are installed blades (3), mounted on a fixed metal frame (6), rigidly fixed in the cross section region of the pyramid, and on a mobile metal frame (4), placed in the base region of the pyramid with the possibility of performing oscillatory motions with the help of a crank mechanism (1), connected via a clutch to an electric motor.
