

**94-0002**

The invention relates to the agricultural engineering, particularly, to the cultivation and sowing mashines.

The apparatus contains the disk working member 1, disk scraper 2 and a spring 3, the scraper axe 4 is rigid fixed with its one end, the scraper 2 is mounted with the displacement possibility on its other end, in the axe middle part it is cuppled to the spring 3 fixed with its other end, the disk working member surface makes an acute angle in relation to the scraper axe crossing surface, which is equal to the angle between the scraper axe and horizontal surface.

The technical result consists in increasing the surface cleaning efficiency of the working member having different configuration.
