

**94-0003**

This invention relates to the construction of containers which can be used in transportation storage and keeping loads in pieces for example crates with fruit, berries and other products. the goal of the invention consists in facilitating the piling up method and to simplify the construction. Besides the fact that the metal carcass consists of vertical elements and horizontal (superior, middle and inferior) from which 4 elements horizontally placed form the palette with runners (2) and guide roller (9) for loading forks. The basic characteristic of this container is that the inferior horizontal carriers in the form of runners together with superior horizontal carriers offers a device in the form of upside down "V" and in the upper part of the carcass on each side of it, horizontal plates are placed to fix the loads and not less than one is rolling.
