

94-0005

It is applied for the salinized and saline-alkali soils improvement. It is realized by lifting and loosening the upper solonchok-like horizon, introduction of calcium comprising ameliorant and displacement under this horizon of an antisalt screen in the form of a layer, namely of organic material with the acid nitrogen comprising substance addition.

It is characterized by the fact that in the capacity of the organic material is used hydrolysis lignin which is introduced in an amount of 400-1200 t/ha of dry substance.
