

**94-0066**

The invention relates to the food production for the agricultural animals. When adding the flower- polling hydrolysate at the compound animal feedstuff of the lactic sucking-pigs, the statural-weight value of such pigs have been much higher than the analogical index of the sucking-pigs which haven't such a compound animal feedstuff with a flower- polling hydrolysate.

So, there appeared an opportunity to decrease the expense of such a valuable product to two times with the help of the rise of the assimilability of the biologically -active additional animal- feeding (flower-polling).
