

94-0178

The invention relates to the medical technique, particularly, to the orthopedics and provides exclusion the sensation of pain in the region of shoulder nervous plexus.

The crutch consists of dress-preserver (1), post (2), handle (3), crampons (4) and (5), tip (6). The handle (3) is fixed at the distance of 50-150 mm from post axe, using the crampons (4).

The handle is positioned at the place hand natural position, which provides to take a considerable ammount of loading on the hand and smooth distributes it to shoulder.

The handle may be fixed on the crutch post with the possibility of turning, shifting along axe and fixation of mounted position. The crutch may be provided with the pivot telescopical jointed with post from tip side with the possibility to shift along the post axe and is fixated in the mounted position.

Furthermore, the dress-preserver may be fixed on the pivot, telescopically linned with the post, having the possibility to turn, to shift along axe and to fixate in mounted position.

It is possible to mount telescopically a cylinder on the crutch post which may be turned, shifted and fixated, in this case the handle is mounted on the cylinder. There are and other combination of crutch and handle.
