

94-0284

The plants of the new sort are characterised by the following morphological characteristics:

The height of plants is 120-140 cm, shape of plants is coniform, corymiform inflorescence of middle density, the leaves are big, sessile, of green light colour.

The plate of middle leaf is elliptic-ovate, the surface is little waved, the colour of corolla is pink. The number of leaves is 25-35.

The medium harvest of dry leaves is 36,4-44,0 q/ha in 4 years of competitive sort testing and 80-85% 1st quality of raw material.

Raw material is skeletal type. The fermented raw material yellow-orange colour with good smoking quality (the sum of appreciative ball is 38). The sort is resistant to burning and lodging, almost doesn't form side-shoots. Possess a field resistance to tobacco mosaic and Y-virus potato, is semiresistant to Aoldison's disease of tomatoes.
