

94-0310

The membrane (1) in the press reservoir, intended for liquid and solid substances separation comprises two directed to the end sides of the press reservoir half-round parts (2) and connected to them on both sides, and the membrane part corresponding approximately to a half of the reservoir lateral surface, which (2) are formed of a texture (3) covered on two sides with a synthetic material, the half-round parts (2) of the membrane are separated into segments, radical to the passing bisectors to which is parallel directed one of the thread systems forming the texture (3).
