

94-0324

The invention relates to packings with evacuation of single utilization of fluid substances, especially to whin cream jelly, mayonnaise etc. and is orientated to increase the rialibility and the snugness of packing exploitation. A rigid plane sheet 1 and flexible sheet 2 form the cavity for fluid substance placement. On rigid plane sheet 1 lengthways to its transversal axis is executed a break line 3 on which sector is formed, at least a proeminence 5, which constitutes the device for local concentration of increased tension of rigid sheet 1 and forming in it a evacuation's aperture at the bending of pecking in v form relate to break line.

The liquid at the evacuation is pouring out in directioned tide. After complete or partial evacuation, the packing unbends, the air is absorbing in aperture together with substance remains, the drops are not forming. Demending on packed substances and conserving and evacuation conditions, proeminences 5 might by different.
