The invention relates to the medical technique, especially to the apparatuses for electrical iono reflexotherapy.

It can be applied for treatment and prophylaxis as well as for regulation of functional state of sportsmen. The electrostimulator contains an active electrode, bound through a galvanic upshort with the source of high voltage, containing discharging and collecting electrodes as well as a passive electrode, also bound to that source; a limiter of dielectrical porous material covers the working surface of the active electrode.

The apparatus effectuates statical and dynamical influence on the skin surface biologically active zones, nerve endings by means of a flow of rapid aeroions.
