

94-0361

The invention related to glass industry and is intended to rise the exploitational properties (resistence, thermal stability, hardness). The device includes electromagnet with a magnetic wire (1) and a lug (4), also a stabilized rectifier (3).

The lugs (4) are made removable, that help to treat glasswares of various hape by a single electromagnet. The lungs area consists of 0,1- 1,2 out of the device's section area, the altitude of the lungs is equal to 1,0-1,1 out of the glasswares altitude. The interpole clearance composite 0,1- 1,2 out of device's diameter. In order to enlarge the electromagnet expiry date, its upper surfase contains heat isolation.
