The invention is related to pointer conversion with frog core with mobile principal point and mobile auxiliary point. The purpose of invention is the increasing of carrying capacity and the stability.

In the pointer conversion with frog core with mobile principal point 3 and mobile auxiliary point 4, those last are executed with using of standard profiles of rails with thickened web and in quality of exterior check rails 5 and 6 in counterpoise with standard profiles of rails with thickened web are installed profile points lop-sided more lower. In this case is preferable the height of profile points lop-sided more lower 5 and 6 at least at the height of foot 9 and 18 of rail with standard profiles of rails with thickened web of tip of frog core more little than the height of standard profiles of rails with thickened web of tip of frog core.
