The proposed invention relates to the wine-making industry and may be used in the remuage process for wine treatment by champanghization method, as well as it can be used in medical (pharmaceutical), chemical and food industries for constant mixing of multicomponent loose and hiquid mixtures. The device allows to maintain an identical incidence angle (from 10 to 70°) of a great amount of bottles under their constant or periodic rotation as well as allows to supplementary smoothly and simultaneously change the incidence of all bottles (from 10 to 70°) during their rotation. The device contains a base, a support and at least, one platform disposed on the shaft for bottles installation, the platform is made with windows, into each of which is placed the holder for, at least, one bottle having a bead on its outside.

The device is not complicated in manufacturing and exploitation, it is reliable, possesses a great productivity.
