

94-0392

The method is used for organic fertilizer obtaining.

The method is carried out by mixing the perhumide organic waster, e.g. dung, bird excrements, and ot with hydroscopic components, e.g. straw, soil, sawdust and ot. The mixture is periodically mixed and is kept up to the maturing. The me thod is characterized in that all the perhumide organic wastes dose is added to the composting mass by portions which differ from each other in mass not more than 2 times, each 20-40 days, not less than 3-4 times during the composting term.
