

95-0019

Utilization: electrotehnics technology of electric motor manufacturing.

The summary of invention: the exterior surface of the package short-circuited rotor with rods of winding in the slots is turned at the mean equal double rated height of the magnetic small bridges above the slots. There are formed the magnetic small bridges during the installation of the shielded cartridge on the package which is made from corrosionstable ferromagnetic material.

The method makes possibility to prove quality of rotors by mean high levelling of magnetic small bridges.
