

95-0050

The invention relates to medical technics and namely to the electron-ion reflexotherapy apparatus.

It may be used for treatment and prophylaxis as well as for the regulation of the patients' functional state.

The bipolar ionic stimulator consists of two high voltage sources of opposite polarity, N active electrodes, each of them being connected to the corresponding source by means of a corresponding gas rarefying element.

The stimulator has a static or dynamic effect on the cutis by means of quick bipolar aerions (biologically active zones of the patent, nervous endings).
