

95-0211

The bottle contains a body with a concave bottom and a cork sealed with a muslet .

The characteristic property of the device consists in the fact, that on the outer surface of the concave bottom is mounted a power unit consequently connected with a chip and a membrane, on the lateral surface of the body is fixed an interrupter electrically connected with the chip, at the same time a dielectric plate is installed between the contacts of the interrupter, mechanically coupled with the muslet.

The technical result in the invention utilization consists in the appearance of a sonorous signal while uncorking the bottle.
