

95-0264

The invention relates to the medicine, more exactly to the organic drugs which possess adsorbing activity and which can be used for rendering special medical assistance in different intoxications and treatment of some diseases.

The summary of the invention consists in the creation of a new adsorbing drug containing carbon prepared of the fruit stones shell chemically activated, in the form of particles with a dispersity of 0,25-1 mm and the pores total volume of 0,76-1,24 cm³/g.

The technical result of the invention consists in the creation of a new adsorbing drug effective for mushroom and medicament intoxication, chronic hepatitis, allergic diseases and other pathology.
