

95-0294

The invention relates to the ether-bearing industry, namely to the extraction of the sclareol from the concrete, obtained from clary sage wastes.

The water-organic phase is separated from the flocculated waxes by decantation at the processing of 1 mass. part of the concrete dissolved in 8 mass parts of the organic solvent with the milk of lime consisting of the 0,5-1 mass part of hydrated lime in 5 mass parts water/ The solvent is distilled off, the obtained technical sclareol is purified by crystallization. Ethanol, methanol, isopropanol and acetone are used as solvent.
