

95-0297

The summary of the invention: the structure includes the expanding shell installed from the french under foundation and buildings base, the expending shell communicates with the device for installation thereof and the device brought into the shell for expanding thereof. The shell cousists of two parts, connected by the reciprocal position fixator. The shell is provided with one pointed and the second open ends. The open end is directed to the device for shell installation and is formed of a jack and a pusher, installed into the french, and of a removing botton closing the shell open end. The expanding device is manufactured in wedge-formed horizontal piles, communicating with the pusher at bringing though the shell open end.
