

96-0061

The invention relates to the air exchange and may be used in the agriculture, particularly, in the buildings for agricultural products storage.

The summary of the invention consists in the fact that the fruits storehouse hatch comprises an articulated gate fixed into the hatch opening, manufactured in the form of a bell-crank and a position limiters thereof. Into the each space of both shoulders there are placed an elastic tank containing water and an opposing spring communicating to the walls thereof, by that one gate shoulder is heat insulated in the exterior part and the other one is insulated in the interior part.

The technical result consists in the mass redistribution in relation to the hinged support.
