

**96-0242**

The invention refers to plant protection and may be used for biologic plant diseases control.

Summary of the invention consists in that there are proposed new strains of *Nectria pityrodes* Montagne J76, J1431, J1432, MOS1 and ROS2 genus for plant fungicidal infections control. The invention also refers to a process for selection of such microorganisms for biological control of plant diseases and to a method of fungicidal infections inhibition. There are also presented a biofungicide, a biofungicidal composition and a process for preparation thereof.

The result of the invention consists in the biological control of the fungicidal plant infections.
