

96-0324

The invention refers to processes and devices used for piling, sorting and drying the green leaves, namely tobacco leaves during harvesting.

The basket (2) is executed in the form of chute (20), the shape and dimension of which correspond to the leaves dimension and shape. In each chute end it is installed a plate (21). The handles (25, 26) facilitate the manipulation of baskets during utilization thereof. Frame structure (24, 27, 28) allows to superpose the baskets with the possibility of changing the distance between them.

The result of the invention consist in diminution of manipulation with leaves, facilitation of removing the leaves from the basket or piling thereof without damage.
