

97-0086

The process includes the vertical trunk formation, directing and fastening the hoses to the espalier and the sprouts having fruit links.

The process is characterized in that from each hoses nod the alternate long and short sprouts with fruit links are formed, the long sprouts are fastened to the second wire, the short ones have a free location at the first wire and the fruit links of short and long sprouts have the opposite direction.

The technical result consists in long and short sprouts formation on the same level in relation to the link.
