

**97-0127**

The invention relates to the agriculture tools.

The Stalev's cutting device contains the body-handle with longitudinal cut in the fore-part and knives articulated on the spring-loaded rod and communicating with the body-handle.

In the fore-part of each knife flat surface is manufactured a slot in the cavity of which is situated a bar fixed to the body-handle. By that, the slot is inclined to the bar side, and the knives blades are made in the form of the groove, the bottom of which is rounded and is maximum approached to the articulation.
