

97-0167

The invention relates to the image registration technique by the mechanical printing and may be used in the holography for edition of copies, television and other domains of technique.

The thermoplastic carrier contains support, adhesive layer and memorizing reliefographic layer on the styrene copolymer and butyl methacrylate base. The copolymer complementary contains glycidyl methacrylate at further components ratio, % mol:

styrene	20...50
butyl methacrylate	40...50
glycidyl methacrylate	10...30.

The technical result consists in reliefographic layer high structurization degree which leads to the increasing the matrix mechanical resistance at the edition.
