

**97-0290**

The invention relates to the tobacco industry, in particular, to the containers for transportation, stacking and storage of tobacco bales.

The container comprises a base 1 made in the form of a rectangular frame with gusset plates 8 at the corners and supporting legs 2, installed at an angle relative to the base sides, stops of the tobacco bales, made in the form of long pins 5, fixed on the back side of the base and in the form of short pins 7, fixed on the fore side of the base, vertical supports 3, slopely mounted one relative to the other onto the lateral sides of the base and connected by means of a strip 4. The upper ends of the supports are bent inside the container. The vertical supports of the container back side are connected by a "U" hook 9.

The technical result consists in the simplification of the container construction.
