

97-0303

The invention relates to the agriculture, in particular, to the viticulture.

The summary of the invention consists in the fact that on the espalier post with polygonal section, the lower end of which is pointed, there are made through holes, the axes of which are perpendicular to the post axis.

The novelty of the invention consists in the fact that on the upper end of the post there is executed a groove parallel to the through holes axes, three of which are arranged in a line transverse to the lateral edge and the fourth is placed under one of the last holes at a distance of at least 300 mm from the post end.

The technical result of the invention consists in the possibility of supporting and tightening the cropping wire at different heights.
