

97-0303

The invention relates to the agriculture, particularly, to the viticulture.

The summary of the invention consists in the fact that the espalier post has the form of a polyhedron, the lower part of which has the form of a pointed polyhedron, on the upper end of the post there is executed a groove and parallel to it on the lateral edges there are made through holes which are arranged in a horizontal line and the axle of which is perpendicular to the post axle.

The second variant represents an espalier post having the form of a polyhedron, the lower part of which has the form of a pointed polyhedron, on the lateral edges on the full height of the post there are made through holes.

The third variant represents an espalier post having the form of a polyhedron, the lower part of which has the form of a pointed polyhedron, on the lateral edge in the upper part of the post there is made a cross groove.

The technical result consists in the possibility of supporting and tightening the cropping wire at different heights.
