

**98-0031**

The invention relates to the construction particularly to the production of decorative coating in the finishing works.

A dry mixture for obtaining a composition for decorative coating of walls contains binder and filler, including triturerated textile fibres, triturerated paper, and decorative and consolidating additives, where relevant.

A process for obtaining a composition for decorative coating of walls consists in obtaining a dry mixture, including trituration of the filler and mixing thereof with dry binder. The obtained dry mixture is additionally triturerated, loosened fluffed and mixed with water immediately before utilization.

A process for restoration of deteriorated coating of walls, made with utilization of such composition, includes removal of the deteriorated coating part of the wall, mixing with water in the ratio of 1 weight part of the removed coating for 4...7 weight parts of water during 1...3 hours, addition of dry binder in the ratio of 0,07...0,13 weight parts thereof for 1 weight part of the removed coating, mixing of the solution up to the formation of a homogeneous consistence and subsequent application thereof on the wall.

The result consists in the creation of a more homogeneous composition, due to the loosening, fluffining and crushing of the mixture, that provides a uniform restoration of the deteriorated coating, and in the improvement of heat-insulating and decorative properties thereof.
