

98-0039

The invention relates to medicine, particularly, to immunology and may be used for treatment of inflammatory and dystrophic diseases of the soft tissues and defects thereof.

The immunotherapy method consists in blood taking, isolation of the immunocompetent cells, stabilization of them into the cultural medium at 37°C during 30 min...48 hours, slurring into the sterile physiologic solution and introducing in a microenvironment of the pathologic process. The stabilization of the immunocompetent cells in the cultural medium may be carried out in presence of the immunomodulation remedies.

The technical result consists in immune reactions and protein synthesis activation and inflammatory reaction inhibition that provides the resolving and regenerative effect.
