

98-0140

The invention relates to the stationery and all-purpose capacities, in particular, to devices for solution application on different surfaces.

The device contains a reservoir, provided at one end with a cork with bulges and at the other end with a neck with solution outlet port. The neck is closed with a cover with rod, one end of which is embedded into the cover body and the other end of the rod passes through the neck port. The reservoir end provided with a cork with bulges serves for solution supply. Summary of the invention consists in that the reservoir is made rigid and the cork with bulges contains an elastic goffered bag with rigid bottom. The elastic goffered bag can be installed inside or outside the cork, and the cork is closed with a small cover. The elastic goffered bag, the cork and the small cover are joined with each other. The device is provided with removable nozzles.

The result consists in applying the solution on a surface of required length and thickness, in the accelerated accomplishment of the works and transportation of the device in different capacities.
