The invention refers to the stationary and to the all-purpose tanks, may be used as a tank for storage and deposition of the solutions on different surfaces.

The device consists of a tank, a cork with bulges, a bar, a neck and a cover. The tank contains on one end a cork with bulges and on the other one - a neck with a channel for solution outlet. The cover is provided with a bar. At the cover closing the free bar end passes through the neck channel. The tank end provided with the cork having bulges serves for solution filling. Summary of the invention consists in, that the cork is provided with an elastic goffered bag having a rigid bottom. The elastic goffered bag may be installed inside and outside the cork. The cork is covered with a cover. The elastic goffered bag, cork and cover are interconnected. The device is provided with the removable pieces.

The result consists in deposition of the solution onto the surfaces of the required length and thickness in the accelerated realization of the diminutive works and transporting the device in different tanks.
