

98-0186

The invention refers to the separating devices, particularly, to the membrane module for separators with at least one or more tubular membranes and may be used for pasty mixtures separation.

The module contains tubular membranes reeled up in the form of wraps and making up a coil. In that way, the membrane total surface per volume unity is increasing, the mounting process is simplified and the conditions of processing the pasty mixtures possessing a high dry materials content are improving.
