The invention relates to the forestry, namely to the processes for packing a clod with a big tree into the container for the transplantation of big trees.

The process for packing a clod with a big tree into a dismountable container includes placement of the container parts into the preliminarily digged up trench around the tree, tightening thereof with the simultaneous tree root cutting with the container knives and clod formation, as well as fixation of the container tightened parts. The container parts tightening is carried out by means of the hydraulic cylinder, the rod of which is joined with the rope encircling from below the container parts.

The technical result consists in increasing the tightening force of the container parts around the clod with the root system of the big tree.
