

**99-0076**

The invention relates to the medicine, in particular to the obstetrics and is used for treatment of puerperal endometritis.

The proposed method consists in the administration of a suspension of mononuclear cells culture, obtained from the recipient blood, paracervically on the 3...6 day in the puerperium 1...3 times in a dose of 2 ml in combination with the administration of uterotonic preparations.

The result of the invention consists in the immunostimulating action, reduction of the endogenic intoxication and medicamental load on the maternal organism.
