

99-0140

The invention relates to medicine, in particular to orthopedics and is provided for surgical reduction of the shank congenital luxation to children.

The proposed method consists in mobilization of the quadriceps femoral muscle, Z-shaped elongation thereof, arthrotony with the cicatricial tissue section, mobilization of the femur and tibia articular surfaces, adaptation thereof, transosseous plasty of the collateral and cruciform ligamentous apparatus, restoration of the quadriceps femoral muscle in the shank flexion position and immobilization in a gypsum plaster.

The result of the invention consists in the correction of the lower extremity axis, recovery of the movements and static stability of the knee-joint.
