

99-0184

The invention relates to the medicine, in particular to the obstetrics and is provided for treatment of gestational pyelonephritis.

The proposed method includes application on the thigh lower third of a cuff connected to a device for pressure creation, creation of a pressure of 40 mm of the mercury column and the subsequent subcutaneous administration of the antibiotic into the shank once in 24 hours during 4...5 days.

The result of the invention consists in the lymphotropic prolonged action of the antibiotic.
