The invention relates to medicine, namely to orthopedics and traumatology.

Summary of the invention consists in that it is carried out the supracondyloid osteotomy of the humerus and cuneiform resection of the bone segment half of the required correction with its base towards the lateral part of the humerus distal portion. Then the obtained segment is turned round with 180° and installed between the osteotomed parts. Afterwards, there are introduced two brooches in the lateral part and one brooch in the medial part of the humerus distal portion.
