The invention refers to agriculture and may be used in the selection for obtaining of triticale hybrid seeds.

The process for obtaining of triticale hybrid seeds includes treatment of the wheat castrate flowers with 0,001...0,005% aqueous solution of steroid glycosides extracted from egg-plant roots, and pollination thereof with rye pollen, which is made in 5...10 min after treatment.

The result of the invention consists in increasing the output of hybrid seeds.
