

a 2004 0131

The invention refers to medicine, namely to orthodontia and may be used for restoration of normal dimensions of the superior dental arch to children with congenital superior labiopalatine cleft after uranoplasty.

Summary of the invention consists in that the orthodontic apparatus includes a palatine plate, consisting of 4 parts, joined by means of three orthodontic screws. At the same time, in the region of the 1-st, 2-nd premolar teeth and of the molar tooth in the left and right posterior parts of the plate there are made occlusal bars.
