

The invention relates to devices and systems for biological and cosmic energy concentration and may be used in medicine as physiotherapeutic device, in agriculture for amelioration of preset characteristics of the vegetable crops or reproduction of crops with preset characteristics, as well as in the food industry for improvement of properties and qualities of the food products.

The proposed device is made in the form of a body of dielectric material, for example, of glass containing at least 24% of PbO, the body being made in the form of pyramid, having a square base, the base side length-height relation being equal to 1,2...1,4, preferably 1,314.

The proposed system contains several above-mentioned devices, for example 5 or 6, placed so as to form the angles of the pyramid or bipyramid, having a square base, at a distance corresponding to the pyramid's base side length and height relation equal to 1,2...1,4, preferably 1,314.
