a 2006 0076

The invention refers to agriculture, namely to a process for vine treatment.
Summary of the invention consists in that the process, according to the first variant, includes the vine treatment with a preparation with fungicidal action against grey rot growth and subsequent treatment with a deactivating ferriferous compound, as deactivating compound being used the solution of citrate-ammoniacal iron(III) with general formula: $[2C_6H_5O_7Fe^{III}\cdot C_6H_6O_7(NH_4)_2\cdot nH_2O]$ with the concentration of 0,15...0,35 g/L, treatment with deactivating compound being carried out 10...12 days before grape harvesting with a consumption of 700...800 L/ha.
According to the second variant, as deactivating compound is used the citrate-ammoniacal iron(III) with general formula: $[2C_6H_5O_7Fe^{III}\cdot C_6H_6O_7(NH_4)_2\cdot nH_2O]$ which is introduced into the preparation with fungicidal action in the concentration of 0,20...0,35 g/L, the treatment being carried out 12...15 days before grape harvesting with a consumption of 700...800 L/ha.
As preparation with fungicidal action against grey rot is used the preparation, containing vinclozolin, with general formula: [(RS)-3-(3,5-dichlorophenyl)-5-methyl-5-vinyl-1,3-oxazolidine-2,4-dione], in the concentration of 2,0...2,5 g/L, and the vine treatment is carried out with a consumption of 700...800 L/ha.
