

a 2008 0104

The invention relates to the field of rendering transport services, namely to the administration of taxi orders for freight and public conveyances.

The system and method for centralized administration of taxi orders comprise at least an external terminal for orders reception, joined with the corresponding customer by means of a stationary phone, mobile phone and/or terminal, connected to the global communication network lines, and connected to a server of the unique database of orders, to which there are connected at least one terminal for each fleet of taxis and one terminal for drivers, rendering private transport services, in the form of mobile phone connected by means of WAP to the global communication network lines. The terminal of each fleet of taxis is joined by mobile terminals with the taxi drivers.
